

NATIONAL EXAMINATIONS – December 2011

04-BS-10, Thermodynamics

3 Hours Duration

**NOTES:**

1. If doubt exists as to the interpretation of any question, the candidate is urged to submit, with the answer paper, a clear statement of any assumptions made.
  2. Any one of the approved Casio or Sharp calculator models is permitted. This is a "Closed-Book" examination with one 8.5×11 inch sheet of notes (both sides) allowed.
  3. Property tables and charts are provided where necessary.
  4. Two questions from part "A" plus four questions from part "B" (a total of six questions) constitutes a complete paper. Unless clearly indicated otherwise by you, only the first two questions from part "A" and the first four questions from part "B" that you answered will be marked.
  5. The mark associated with each question is specified.
-

**PART A. DO ONLY TWO OF QUESTIONS 1, 2, or 3**  
(Each question is worth 20 marks)

1. An ideal Rankine cycle with reheat has a boiler pressure of 4.0 MPa and a condenser pressure of 10 kPa. Steam enters both the high- and low-pressure turbines at 700°C, and it leaves the condenser as a saturated liquid. The quality of the steam leaving the low-pressure turbine is 0.95. Sketch the cycle on a T-s diagram with respect to saturation lines. Calculate the following:
  - (a) the pressure in the reheater
  - (b) the work produced by both the high- and the low-pressure turbines, in kJ/kg
  - (c) the heat transfer in the condenser and the reheater, in kJ/kg
  - (d) the thermal efficiency, and
  - (e) the second law efficiency of the cycle assuming a source temperature of 1200 K and a sink temperature of 288 K.
2. Air enters the compressor of an ideal gas-turbine cycle at 100 kPa, 300 K, and a volumetric flow rate of  $5 \text{ m}^3/\text{s}$ . The air is compressed in two stages to 1200 kPa, with intercooling to 300 K between the stages at a pressure of 350 kPa. The turbine inlet temperature is 1400 K and the expansion occurs in two stages, with reheat to 1340 K between the stages at a pressure of 350 kPa. Determine
  - (a) the thermal efficiency of the cycle,
  - (b) the back work ratio (the ratio of compressor work to turbine work), and
  - (c) the net power developed, in kW.
3. A vapour-compression heat pump system uses Refrigerant 134a as the working fluid. The refrigerant enters the compressor at 0.24 MPa and 0°C with a volumetric flow rate of  $0.6 \text{ m}^3/\text{min}$ . Compression is adiabatic to 0.9 MPa and 60°C, and saturated liquid exits the condenser at 0.9 MPa. Sketch the cycle on a T-s diagram with respect to saturation lines. Determine
  - (a) the power input to the compressor, in kW,
  - (b) the heating capacity of the system, in kW,
  - (c) the coefficient of performance, and
  - (d) the compressor isentropic efficiency.

**PART B. DO ONLY FOUR OF QUESTIONS 4, 5, 6, 7, 8 or 9**  
(Each question is worth 15 marks)

4. 1.5 kg of air (Assume ideal gas behaviour) executes a Carnot power cycle having a thermal efficiency of 50%. The heat transfer to the air during the isothermal expansion is 40 kJ. At the beginning of the isothermal expansion, the pressure is 700 kPa and the volume is  $0.12 \text{ m}^3$ . Sketch the cycle on  $p-v$  diagram and determine

- (a) the maximum and minimum temperatures in the cycle, in K, and  
(b) the work and heat transfer for each of the four processes, in kJ.
5. An ideal Otto cycle with air as the working fluid has a compression ratio of 8. The minimum and maximum temperatures in the cycle are 310 and 1600 K, respectively. Accounting for the variation of specific heats with temperature, determine
- (a) the amount of heat transferred to air during the heat addition process, in kJ/kg,  
(b) the net work output of the cycle, in kJ/kg, and  
(c) the thermal efficiency.
6. Air enters a nozzle at 180 kPa and 707°C, with low velocity. The nozzle expands the air adiabatically to a pressure of 70 kPa. The isentropic efficiency of the nozzle is 90%. Sketch the process on a T-s diagram. Accounting for the variation of specific heats with temperature, determine
- (a) the exit velocity of the air, and  
(b) the exit temperature of the air.
7. A rigid tank initially contains 0.5 kg of steam at 700 kPa and 320°C and is connected through an insulated valve to a steam supply line that supplies steam at a constant condition of 1.5 MPa and 320°C. The valve is opened so that the supply steam flows slowly into the tank until the pressure and temperature inside are 1.0 MPa and 320°C. Determine
- (a) the final mass of steam in the tank, and  
(b) the heat transfer to or from the steam in the tank during the process.
8. A mixture of 65% of O<sub>2</sub> and 35% of CO<sub>2</sub> gases (by mole numbers) is compressed isentropically in a compressor. The mixture enters the compressor at 100 kPa and 300 K and leaves at 500 kPa. Assume constant specific heats at room temperature. Treat the mixture as an ideal gas. Determine the work input to the compressor per unit mass of the mixture.
9. Steam at 0.8 MPa and 350°C enters an open feedwater heater operating at steady state. A separate stream of liquid water at 50 kg/s enters at 0.8 MPa and 35°C. A single mixed stream exits as saturated liquid at 0.8 MPa. Heat transfer with the surroundings and kinetic and potential energy effects can be ignored. Determine
- (a) the mass flow rate of the steam, in kg/s, and  
(b) the rate at which entropy is produced within the feedwater heater, in kJ/K·s.

\*The unit kJ/(kg · K) is equivalent to kPa · m<sup>3</sup>/(kg · K). The gas constant is calculated from  $R = R_u/M$ , where  $R_u = 8.314 \text{ kJ}/(\text{kmol} \cdot \text{K})$  and M is the molar mass.
